## 2. Note

---

Please read these operating instructions before unpacking and putting the unit into operation. Follow the instructions precisely as described herein.

The instruction manuals on our website [www.kobold.com](http://www.kobold.com) are always for currently manufactured version of our products. Due to technical changes, the instruction manuals available online may not always correspond to the product version you have purchased. If you need an instruction manual that corresponds to the purchased product version, you can request it from us free of charge by email ([info.de@kobold.com](mailto:info.de@kobold.com)) in PDF format, specifying the relevant invoice number and serial number. If you wish, the operating instructions can also be sent to you by post in paper form against an applicable postage fee.

The devices are only to be used, maintained and serviced by persons familiar with these operating instructions and in accordance with local regulations applying to Health & Safety and prevention of accidents.

When used in machines, the measuring unit should be used only when the machines fulfil the EC-machine guidelines.

### **as per PED 2014/68/EU**

In acc. with Article 4 Paragraph (3), "Sound Engineering Practice", of the PED 2014/68/EU no CE mark.

## 3. Instrument Inspection

---

Instruments are inspected before shipping and sent out in perfect condition.

Should damage to a device be visible, we recommend a thorough inspection of the delivery packaging. In case of damage, please inform your parcel service / forwarding agent immediately, since they are responsible for damages during transit.

### **Scope of delivery:**

The standard delivery includes:

- Electronic Mass Flow Meter      model: MAS
- Connector

## 4. Regulation Use

---

Any use of the Electronic Mass Flow Meter, model: MAS, which exceeds the manufacturer's specifications, may invalidate its warranty. Therefore, any resulting damage is not the responsibility of the manufacturer. The user assumes all risk for such usage.

## 5. Application

---

The KOBOLD Electronic Mass Flow Meter, model: MAS, makes very precise measurements of the Mass Flow Rate of gases in different measuring ranges from 0 - 10 Ncm<sup>3</sup>/min up to 0 - 500 NI/min nitrogen. The operation of the meter is based on the calorimetric principle.

The measuring accuracy is  $\pm 1,5\%$  of full scale including linearity over 15 to 25 °C and 0.3 to 4 bar absolute. Its response time is 800 ms. The typical response time is 6 seconds to display 98% of the full scale value. This can be realised in between 25 to 100% of the full scale value.

Compared to most of the volume flow meters there is no temperature- or pressure-correction necessary. This means that the MAS is ideally suited for almost every gas flow application. Typical industrial applications are process control, laboratory measuring tasks, OEM applications, gas indication panels, leakage and filter monitoring.

### Display rotatable

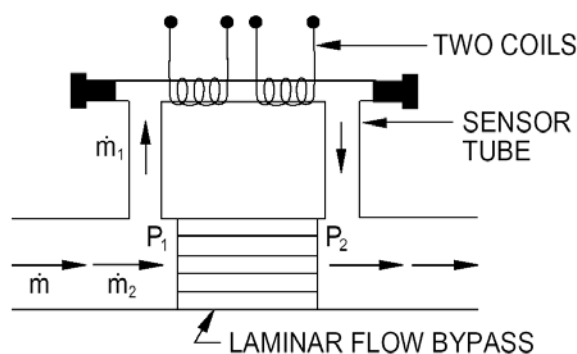

## 6. Operating Principle

### 6.1 Measuring principle

The operation of the Mass Flow Meter, model: MAS, is based on the principle of heat transport (first law of thermodynamic).

The medium flows through the bypass measuring system. Gas enters the MAS flow body and divides into two flow paths. Part of the flow goes through the laminar flow bypass the other part flows through the above located measuring pipe.

Due to the differential pressure between P1 and P2 which is generated by the laminar flow bypass element a part flow ( $\dot{m}_1$ ) is separated from the main flow ( $\dot{m}$ ) and guided through the sensor tube.

Two resistance temperature detectors (RTD elements) transferring a constant amount of heat to the gas stream are mounted on the measuring tube. Under flow conditions, the gas molecules absorb and transport the heat away from one to the other coil. The resulting temperature difference is detected by the RTD-sensors and evaluating by the measuring electronic into an output signal or a display value. Since the heat is transported by gas molecules, the output signal is linear proportional to the gas mass flow.

FIRST LAW OF THERMODYNAMICS  
(HEAT IN = HEAT OUT)  
 $H = \dot{m}_1 C_p (T_2 - T_1) + H_0$

$$\dot{m} = \frac{H - H_0}{C_p \Delta T}$$

## 7. Mechanical Installation

---

In order to ensure a successful installation, inlet and outlet tubing or piping should be in a clean state prior to plumbing your MAS to the system. MAS is applicable to clean gas only because particles and other foreign matter may pollute the sensor tube and laminar flow element and cause wrong measurement results. In case of doubt, we recommend to use filters.

The following working pressures and/or medium temperatures may not be exceeded:

- 10 bar or 50 °C for devices with nylon casing (MAS-1xxx and MAS-2xxx)
- 35 bar or 50 °C for devices with stainless steel casing (MAS-3xxx and MAS-4xxx)

Be sure that the arrow on the side of the transducer points in the direction of flow. With the nylon casing you must take care not to turn the thread too far (maximum 1.5 turns).

---

**Attention! Over-tightening will crack the fittings and shift calibration.**

---

The preferred mounting position is horizontal. A vertical installation is possible, but this must be considered during factory-calibration, since one has to count on a zero-point movement depending on the operating pressure.

Swagelok and NPT screw connections must not be removed from the casing nor should their position be altered since they form a unit with the laminar element and could alter the calibration.

### **Swagelock-connections:**

For the first installation of compression fittings, simply insert the tubing into the fitting. Make sure that the tubing rests firmly on the shoulder of the fitting and that the nut is hand-tight. Mark the nut at the six o'clock position. While holding the fitting body steady with a back-up wrench, tighten the nut  $1\frac{1}{4}$  turns. Watching the mark on the nut, make one complete revolution and continue to the nine o'clock position. After this, the fitting can be reconnected by tightening with a wrench. Do not fail to use a back-up wrench or the inlet fitting may be damaged.

## 8. Electrical Connection

The standard MAS is provided with a 9-pin “D” sub type connector located on the side of the MAS.

**Attention! Ensure that the voltage of your installation corresponds with the voltage of the measuring device.**

**Attention! A wrong terminal assignment may lead to a damage of the electronic. If a power supply is connected, do not supply with any additional voltage on the 9-pin-Sub-D-connector.**

When the MAS is configured for a remote display, the display is supplied via the 9-pin “D” connector.

**Attention! Please note that opening the device cancels the guarantee. We therefore recommend that you let such work be done by KOBOLD Messring GmbH.**

<u>Pin No.</u>	<u>Function</u>
1	No Connection
2	Flow Signal Ground
3	0 to +5 VDC Flow Signal
4	+ Power Supply (12 VDC) *1, *2
5	Remote Display Flow Signal
6	Remote Display Ground
7	Power Supply Ground
8	Analogue output 4 to 20 mA Ground
9	Analogue output 4 to 20 mA signal

\*1 Power supply voltage must be specified at time of order. Operating a 12 VDC meter at 24 VDC will cause damage. Running a 24 VDC meter at 12 VDC will result in faulty operation.

\*2 Do not supply + DC power at the "D" connector while using a power supply at the DC power jack. Both supplies may be damaged.

## 8.1 Power supply

If you use a KOBOLD MAS-5000 or MAS-5015 power pack, insert the jack plug in the foreseen socket on the Mass Flow Meter MAS. Then simply connect the power unit to the mains.

If not using a MAS-5000 or MAS-5015 power pack, supply the MAS via the 9-Pin Sub-D-Connector with a voltage of 12-15 VDC. MAS Flow Meters require a single +12 to +15 VDC power supply capable of providing a minimum current of 100 mA. The MAS can also be configured for +24 VDC power at 100 mA.

After the power has been switched on the output signal is initially maximum for a short time (c. 10-20 seconds). It then returns to 0 Volt (or 4 mA, depending on the model provided). Please note that the warming up period for the MAS should be about 15 minutes.

After the warming up phase the MAS indicates the measured flow values on the display.

## 8.2 Output signals

The output signal is obtained from the 9-pin "D" connector. A 0 to 5 VDC output signal linearly proportional to gas mass flow rate is standard. A 4-20 mA current loop signal is optionally available.

## 8.3 Display

KOBOLD Mass Flow Meters, model MAS, for gases are available with an integrated digital display, a remote digital display and without a digital display. The decimal point on the version with digital display is set at the factory. It is always a 3 ½-digit display.

**Attention! KOBOLD Messring accepts no liability for any damage, claims or faults resulting from operation with oxygen. MAS devices can be manufactured oil and grease free if desired.**

## 9. Operation

---

### Pressure- and temperature conditions

The gas flow rate output of your MAS always refers to “standard” conditions of 21 °C (70 °F) and 760 mm of mercury (1 atmosphere), unless you have specified otherwise. Make sure that your MAS is always calibrated on the operating conditions.

### Accuracy

The standard accuracy of the MAS is  $\pm 1.5\%$  of full scale.

### Overranging

If the flow rate exceeds the full scale range listed on your MAS’s front label, the output signal and digital display (if available) will read a higher value.

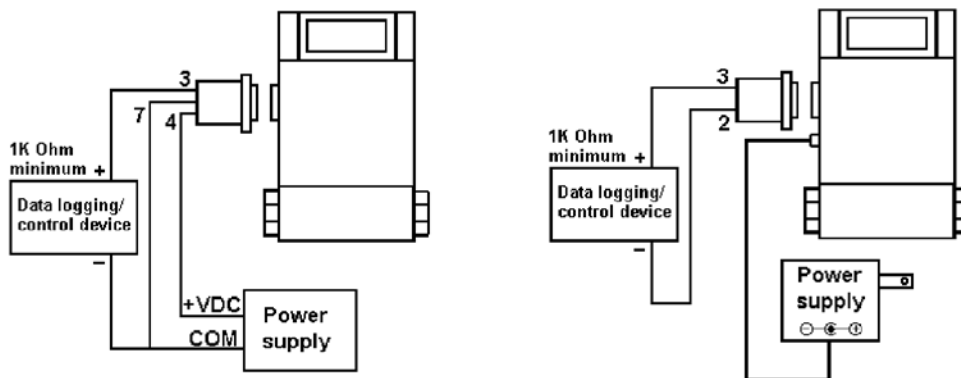

Overrange conditions are indicated from the display and/or output by going to a high level, above the full scale range. After the overrange condition has been removed, it may take several seconds for the MAS to recover and resume normal operation. This will not harm the instrument.

### Zero and Span Adjustments

The zero and span potentiometers are accessed through marked ports on the right side of your MAS. The analogue output is factory set and should only be adjusted, when the zero point is drifting away more than 2% of the maximum scale value and when you are absolutely sure that no gas is flowing.

### Standard 0-5 V<sub>DC</sub> Output Signal

The standard 0-5 V<sub>DC</sub> output signal flows from Pin 3 (0-5 V<sub>DC</sub> Out) through the load (1 K Ohm minimum) to Pin 7 (Power Common). The figure below is a typical example of input power and output signal connections.

**Optional 4-20 mA output signal**

As an option for all MAS Mass Flow Meters, a 4-20 mA analogue output is available. The output signal is provided at 9-Pin Sub-D-Connector. (Attention! Maximum load 50 to 500 Ohms)

**Single unit**

**Multiple Installation**

## 10. Totalizer

---

The totalizer is designed to provide a totalizer function for the MAS-11/MAS-31. It will display the totals as well as the flow.

### Display:

The totalizer display has three screens which are accessed by pressing the button as indicated below:

- Screen 1 (start-up screen): Flow units are shown together with the actual flow  
Screen 2: Totalizer  
Screen 3: Actual flow is shown together with the totalizer

### Totalizer:

A total of 8 digits can be shown by the totalizer ranging from .0000001 to 99999999. The decimal point will automatically shift position as the total increases. Upon reaching the maximum count (99999999), the totalizer will “roll-over” be cleared and counting starts from zero again.

The totalizer is cleared by going to screen 2 or 3 and then press the button for more than 5 seconds. The clearing of the totalizer can be observed on the screen.

The total count is stored in non-volatile memory every 5 minutes. If the unit is switched off within 5 minutes from power-up then no total will be saved and the previous total will be shown at the next power-up.

---

**Due to the combination of the hardware/LCD it may happen that during power up the screen remains blank. Please turn the unit off and then back on again.**

---

---

## 11. Maintenance

---

### Sensor cleaning and Inspection

Your MAS essentially requires no maintenance and has no regular maintenance schedule, other than periodic flow path cleaning if the gas is dirty. Calibrations may be scheduled once or twice yearly, depending on the accuracy to be maintained, or as needed.

It is recommended that your MAS be returned to Kobold Messring if cleaning, repair, or recalibration are necessary. This is usually your most cost-effective and reliable alternative.

---

**Attention! If you wish to clean your MAS purge it with a neutral gas (e.g. nitrogen) thoroughly before disconnection from the gas line when toxic or corrosive gases have been measured. Never return an MAS to KOBOLD Messring or any other repair or calibration facility without fully neutralising any toxic gases trapped inside.**

---

---

**Note: A cleaning, described as follows, is only possible with instruments made out of stainless steel (MAS-3xxx and MAS-4xxx)**

---

Cleaning is accomplished by simply rodding out the sensor with the Sensor Cleaning Stylette, available from Kobold Messring for this purpose. (A 0.020 inch to 0.028 inch diameter piano wire may also be used.) During maintenance and cleaning please observe the following steps:

1. Remove the unit from the system.
2. Remove the two socket head access port plugs with a 6mm (¼ inch) allen wrench.
3. Visually inspect the sensing ports and sensor concerning dirt and corrosion.
4. Use a hemostat or tweezers to push the cleaning wire into the downstream opening of the sensor tube. Do not force the cleaning wire; move it back and forth – **Do not twist or rotate.**
5. Flush the sensor tube with a non-residuous solvent. In cases where solids are deposited on the sensor and can not be removed, units should be returned to factory for complete cleaning and re-calibration.
6. Blow dry all parts with dry nitrogen and re-assemble the unit.
7. When the transducer is re-installed in the system, leak test the connections. Do not use a liquid leak-search medium, instead watch the possible arising pressure loss in your system.
8. Check transducer calibration.

## 12. Technical Information

---

Field of application:	suited only for dry, oil-free gases
Measuring accuracy:	±1,5 % f.s. (with calibrated performance characteristics, otherwise observe pressure and temperature coefficients)
warm up time:	approx. 15 min.
Option:	±1 % v. f.s. (only up to 0-100 Ncm <sup>3</sup> /min. measuring range with stainless steel case)
Standard calibration:	1013,25 mbar abs., +21 °C option: to customer specification
Temperature coefficient:	0,15 % f.s. / °C
Pressure coefficient:	0,3 % f.s. / bar
Reproducibility:	± 0,5 % f.s.
Response time (within 25 - 100 % of measuring range):	6 s until 98 % of actual flow rate is indicated
reaction time:	800 ms
Max. medium- and ambient temperature:	50°C
Max. working pressure:	nylon: 10 bar stainless steel: 35 bar
Installation position:	any (see factory calibration)
Gas density:	1 x 10 <sup>-4</sup> cm <sup>3</sup> /s He (nylon) 1 x 10 <sup>-7</sup> cm <sup>3</sup> /s He (stainless. steel case)
Wetted parts:	5 % either glass-fibre-reinforced nylon or stainless steel material no. 1.4401
Seals:	FPM (option: Kalrez, Neopren)
Supply voltage:	12-15 VDC
Output:	linear 0 - 5 VDC (load min. 2000 Ω) option: 4 - 20 mA (load max. 500 Ω)

### 13. Conversion to other Working Conditions

The flow rate of your MAS is referenced to certain “standard” Conditions of temperature and pressure. Unless otherwise specified in your order, these standard conditions are 21 °C (70 °F) and 760 mm of mercury (1 atmosphere). If you wish to convert to other “standard” conditions or to find the “actual” conditions in the pipe where your MAS is installed, use the following relationship:

$$Q_2 = \frac{P_1}{P_2} \times \frac{T_2}{T_1} \times Q_1$$

( )<sub>1</sub>= Refers to the standard conditions with which your MAS was calibrated

( )<sub>2</sub>= Refers to the new standard conditions or to the actual temperature and pressure conditions in the pipe,

Q<sub>1</sub>= The gas mass flow rate referenced to the calibrated standard conditions (SCCM or SLM),

Q<sub>2</sub>= The gas mass flow rate referenced to the new standard or actual conditions (SCCM or SLM–“S” means “standard”; ACCM or ALM–“A” means “actual”),

P = Absolute pressure (kg/cm<sup>2</sup> or psia), and

T = Absolute temperature (°K or °R) °K = °C + 273; °R = °F + 460)

#### Example 1 changing „standard“ conditions

If your MAS has a flow rate reading of 10.00 SLM and was calibrated at standard conditions of 70 °F (21 °C) and 1 atmosphere (14.7 psia), and if you wish to convert this reading to standard conditions of 32 °F (0 °C) and 1 atmosphere, then you would use the equation as follows:

$$Q_2 = \frac{1\text{bar}(abs.)}{1\text{bar}(abs.)} \times \frac{273K}{(273K + 21K)} \times Q_1$$

$$Q_2 = 0,928 \times 10\text{NI} / \text{min} = 9,28\text{NI} / \text{min}$$

So, you can see that the flow rate referenced to 0 °C will be approximately 7% lower than when referenced to conditions of 21 °C.

#### Example 2 Finding the “Actual” flow rate

If the flow rate and calibrated standard conditions are as given in Example 1 and you wish to find the actual flow rate at 100 °F and 30 psig, then you would use equation as follows:

$$Q_2 = \frac{14.7}{14.7 + 30} \times \frac{460 + 100}{460 + 70} (10.00) = 3.47 \text{ slm}$$

## K-factors, gas-tables and conversion formulas

In the following formulas and tables K-factors are used for calibrating its flow rate values. This has two advantages:

- a) Calibrating an “actual” gas with a reference gas. This is particularly useful if the actual gas is not a common gas or if it is a so-called “nasty” gas (i.e., toxic, flammable, corrosive, etc.).
- b) Interpreting the reading of a flow meter or flow controller which has been calibrated with a gas other than the actual gas.

Using these formulas, the following fundamental relationship is used:

$$\frac{Q_1}{Q_2} = \frac{K_1}{K_2} \quad (1)$$

Where:

Q = The volumetric flow rate of the gas referenced to standard conditions of 0°C and 760 mm Hg (SCCM or SLM)

K = The “K” factor defined in equation (6)

( )<sub>1</sub> = Refers to the “actual” gas

( )<sub>2</sub> = Refers to the “reference” gas

The K-factor is derived from the first law of thermodynamics applied to the sensor tube.

$$H = \frac{mC_p\Delta T}{N} \quad (2)$$

where:

H = The constant amount of heat applied to the sensor tube

m = The mass flow rate of the gas (gm/min)

C<sub>P</sub> = The specific heat coefficient of the gas (Cal/gm);  
C<sub>P</sub> is given in the gas tables (at 0 °C)

ΔT = The temperature difference between the upstream and downstream coils

N = A correction factor for the molecular structure of the gas given by the following table:

Number of Atoms in the Gas Molecule	N
Monatomic	1.040
Diatomic	1.000
Triatomic	0.941
Polyatomic	0.880

The mass flow rate can also be written as:

$$m = \rho Q \tag{3}$$

where:

$\rho$  = The gas mass density at standard conditions (g/l);  $\rho$  is given in the tables (at 0 °C, 760 mm Hg).

Furthermore, the temperature difference  $\Delta T$  is proportional to the output voltage  $E$  of the Mass Flow Meter

$$\Delta T = aE \tag{4}$$

where:

$a$  = constant.

If we combine Equations (3) and (4), insert them into Equation (2), and solve for  $Q$ , we get:

$$Q = \left( \frac{bN}{\rho C_p} \right) \tag{5}$$

where:

$b$  =  $H/aE = A$  constant if the output voltage is constant.

For our purposes, we want the ratio of the flow rate  $Q_1$ , for an actual gas to the flow rate of a reference gas  $Q_2$ , to produce the same output voltage in a particular Mass Flow Meter or controller.

We get this by combining equations (1) and (5):

$$\frac{Q_1}{Q_2} = \frac{K_1}{K_2} = \frac{\left( \frac{N_1}{\rho_1 \cdot x C_{p1}} \right)}{\left( \frac{N_2}{\rho_2 \cdot x C_{p2}} \right)} \tag{6}$$

Please note that the constant  $b$  cancels out. Equation (6) is the fundamental relationship used in the accompanying tables. For convenience, the tables give “relative” K-factors, which are the ratios  $K_1/K_2$ , instead of the K-factors themselves.

In the third column of the tables, the relative K-factor is  $K_{\text{actual}}/K_{\text{references}}$ , where the reference gas is a gas molecularly equivalent to the actual gas. In the fourth column, the relative K-factor is  $K_{\text{actual}}/KN_2$ , where the reference gas is the commonly used gas, nitrogen ( $N_2$ ). The remaining columns give  $C_p$  and  $r$ , enabling you to calculate  $K_1/K_2$  directly using Equation (6). In some instances,  $K_1/K_2$  from the tables may be different from that which you calculate directly. The value from the tables is preferred because in many cases it was obtained by experiment.

Kobold calibrates every MAS Mass Flow Meter with primary standards using the actual gas or a molecularly equivalent reference gas. The calibration certificate accompanying your MAS will cite the reference gas used. When a reference gas is used, the actual flow rate will be within 2-4% of the calculated flow rate.

**Example:**

A MAS is calibrated for nitrogen (N<sub>2</sub>), and the flow rate is 1000 SCCM for a 5 VDC output signal. The flow rate for carbon dioxide at a 5 VDC output is:

$$Q_{(CO_2)} / Q_{(N_2)} = K_{(CO_2)} / K_{(N_2)}$$
$$Q_{(CO_2)} = (0,74 / 1,000) 1000 = 740 Ncm^3 / min$$

**Calculating gas mixtures**

Equation (6) is used for gas mixtures, but we must calculate  $\frac{N}{\rho \cdot C_p}$  for the mixture.

The equivalent values of r, C<sub>p</sub>, and N for a gas mixture are given as follows:  
The equivalent gas density is:

$$\rho = (m_1 / m_T) \rho_1 + (m_2 / m_T) \rho_2$$

where:

m<sub>T</sub> = m<sub>1</sub> + m<sub>2</sub> = total mass flow rate (gm/min),

( )<sub>1</sub> = Refers to gas #1, and

( )<sub>2</sub> = Refers to gas #2.

The equivalent specific heat is:

$$C_p = F_1 C_{p1} + F_2 C_{p2}$$

where:

$$F_1 = (m_1 \rho_T) / (m_T \rho)$$

$$F_2 = (m_2 \rho_2) / (m_T \rho)$$

The equivalent value of N is:

$$N = (m_1 / m_T) N_1 + (m_2 / m_T) N_2$$

The equivalency relationships for r, C<sub>p</sub>, and N for mixtures of more than two gases have a form similar to the dual-gas relationship given above.

## 14. Order Codes

### Order details Nylon® version (example: MAS-1002 00 V2 0)

Measuring range for N <sub>2</sub>	Max. pressure lost	Model			Connection	Voltage supply	Output

When placing an order, please specify detailed service conditions (type of gas, flow rate, pressure, temperature etc.)

### Accessories: Connector power supply

Model	Input	Output
MAS-5000	110 V <sub>AC</sub>	12 V <sub>DC</sub> /1.9 W
MAS-5015	230 V <sub>AC</sub>	15 V <sub>DC</sub> /6 W

## 15. Dimensions

Case L (Stainless steel and Nylon®)

Case M (Stainless steel)

Case H (Stainless steel)

## 16. Disposal

---

### Note!

- Avoid environmental damage caused by media-contaminated parts
- Dispose of the device and packaging in an environmentally friendly manner
- Comply with applicable national and international disposal regulations and environmental regulations.

### Batteries

Batteries containing pollutants are marked with a sign consisting of a crossed-out garbage can and the chemical symbol (Cd, Hg, Li or Pb) of the heavy metal that is decisive for the classification as containing pollutants:

1. „Cd" stands for cadmium
2. „Hg" stands for mercury
3. „Pb" stands for lead
4. „Li" stands for lithium

### Electrical and electronic equipment

## **18. EU Declaration of Conformance**

---

We, KOBOLD Messring GmbH, Hofheim-Ts, Germany, declare under our sole responsibility that the product:

**Electronic Mass Flow Meter    model: MAS**

to which this declaration relates is in conformity with the standards noted below:

**EN 61326-1:2013**    Electrical equipment for measurement, control and laboratory use - EMC requirements - Part 1: General requirements

Also, the following EC guidelines are fulfilled:

**2014/30/EU**            **EMC Directive**  
**2011/65/EU**            **RoHS (category 9)**
